

Fuel use · model vs published data

2025 model outputs · screening comparisons with differing cycles, vehicles and test conditions

2025 model run Published value / range

Range bars use the midpoint; whiskers show published ranges, not statistical uncertainty.
The Corolla estate comparison uses the existing hatchback approximation. Exact road load and control are not matched.

Electricity use · model vs published measurements

2025 model outputs · screening comparisons with differing cycles, vehicles and test conditions

Model: onboard Model: charging losses Published measurement

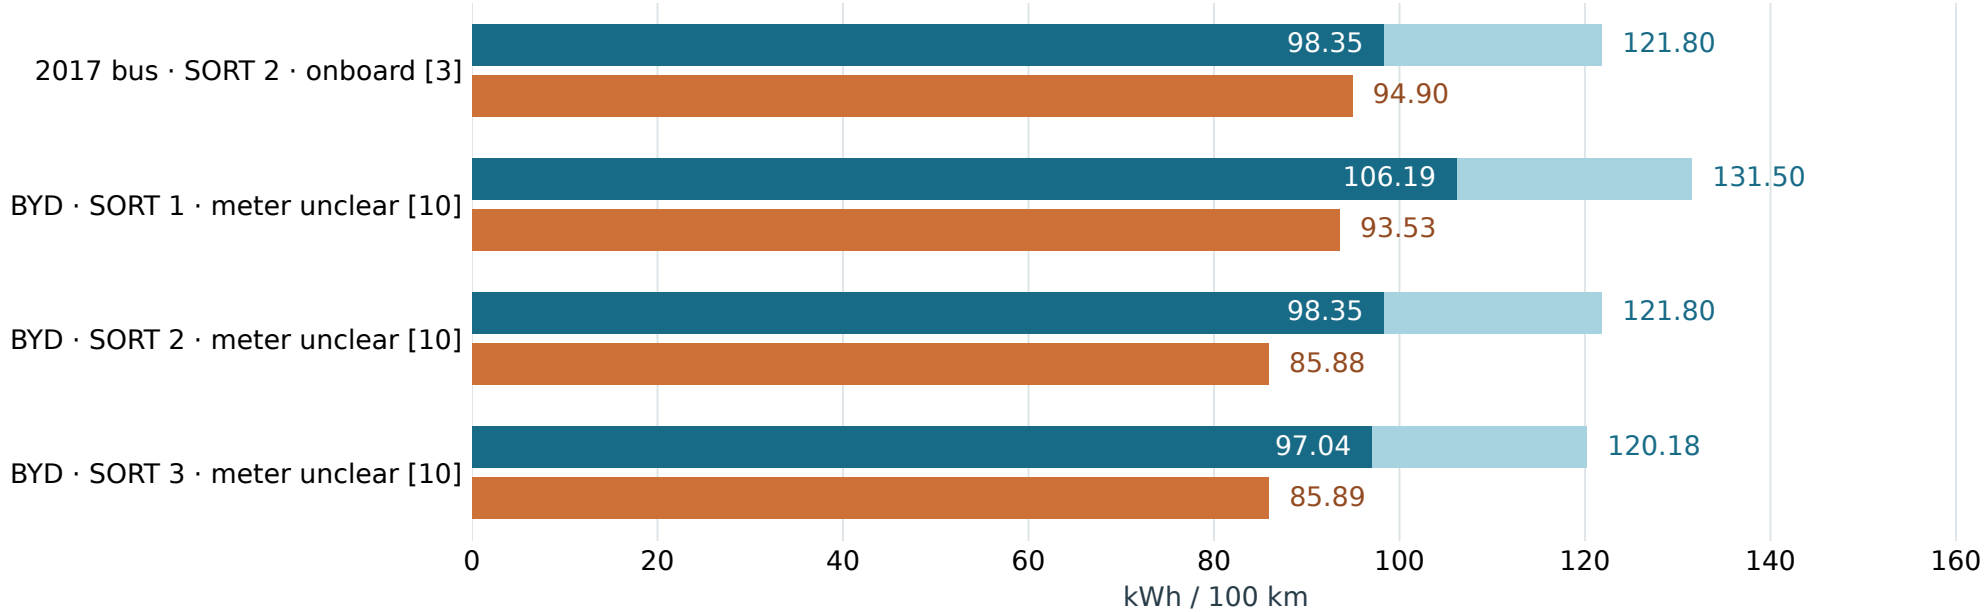

Electric cars · charging energy

Model: generic WLTC classes. Published: ADAC Ecotest, including charging losses.

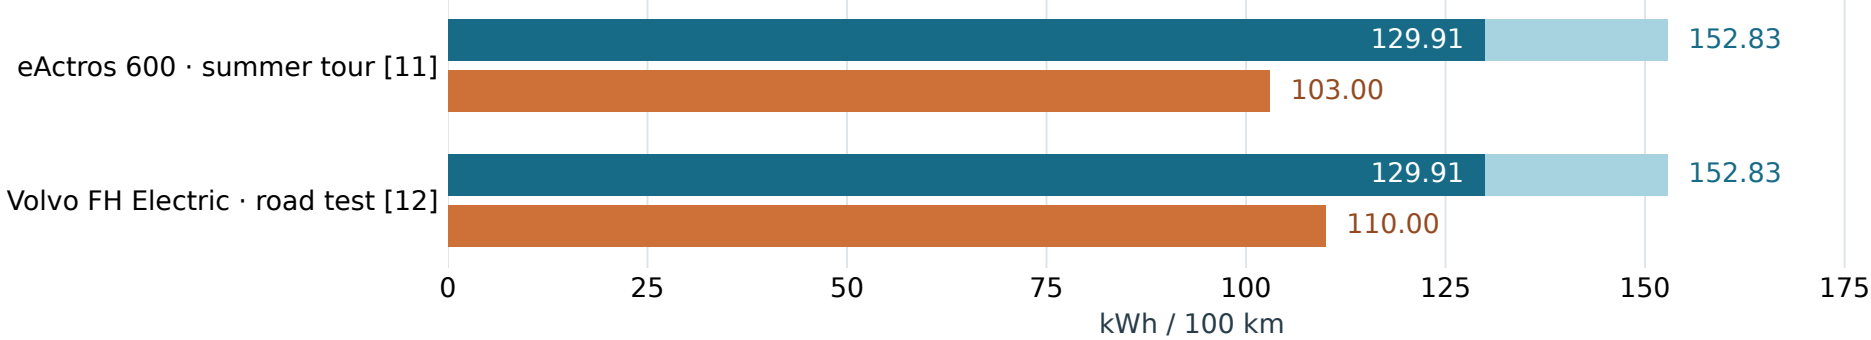

Electric buses · onboard and charging energy shown

BYD meter boundary unclear; 2017 measurement onboard. Masses and auxiliaries differ.

Electric trucks · different routes and loads

Model: 32.98 t, Long haul. Tests: 40 t; exact meter boundaries unclear.

Model bar total = charging energy; white labels = onboard energy. Use the boundary appropriate to each measurement.

Cars use class proxies, including a compact proxy for the EV3 SUV; vehicle mass, road load and power are not matched.

BYD SORT tests: 16.675 t, auxiliaries off. Model SORT runs: 12.56-13.05 t, default auxiliaries.
